**Subject: PTO Spring Centering Coupler Rework**

The PTO Spring Centering Coupler on units listed above is rigidly mounted to the engine flywheel and does not properly absorb cyclical loading inherent in diesel engines.

This situation may allow the PTO Spring Centering Coupler to develop fractures around the centering hub and disengaging the PTO pump, rendering the cutting units inoperable.

The improved PTO Spring Centering Coupler incorporates a load absorbing spring hub, which offers improved durability and simplifies center hub alignment.

Contact your local Toro distributor for details regarding the Factory Rework Program for installation of the improved PTO Spring Centering Coupler.
